NAAC ACCREDITED 'A' GRADE

Topic: Amino acids-Introduction

Course Title: Chemistry (Gen)

Paper: CC-4/GE-4

Semester: 4(Gen)

Name of the Teacher: Prabal Giri

Name of the Department: Chemistry

AMINO ACIDS for SEM-4

(Prepared by Dr. P. Giri, Dept. of Chemistry, Vivekananda College, Thakurpukur)

Amino acid \Rightarrow any molecule containing both an amino group and acid group

Simplest amino acid: Glycine (Abbr: Gly)

The term "amino acid" is always used to refer to an α -amino carboxylic acid.

Alanine, (R=CH₃) / Ala

Except Gly, the α -amino acids are chiral.

L-alanine
(S)-alanine

L-(-)-glyceraldehyde
(S)-glyceraldehyde

An L-amino acid
(S) configuration

Observation

D-amino acids are occasionally found in nature.

Standard amino acids

20 common α -amino acids that are found in nearly all proteins.

(*) ⇒ Essential Amino Acid

Essential Amino acids (E.A.A.)

Humans can synthesize about half of the amino acids needed to make proteins. Other amino acids called essential amino acids. Ten essential amino acids are the following:

Arg Val Met Leu Thr Phe His
Ile Lys Trp

Proteins that are containing all E.A.A. in about the right proportions for human nutrition are called complete protein, e.g. fish, milk, egg.

If deficient of E.A.A. \Rightarrow Incomplete protein
e.g. plant proteins, rice, beans, corn, wheat

Dipolar ion or Zwitterion

Although commonly written amino acids with an intact carboxyl ($-\text{COOH}$) gr. and amino ($-\text{NH}_2$) gr., their actual structure is ionic and depends on pH. The carboxyl gr. loses a proton, giving a carboxylate ion and the amino gr. is protonated to an ammonium ion. This structure is called a dipolar ion or a Zwitterion.
